Dear Abby:

DEAR ABBY: My mother-in-law carries my father-in-law his juice while he is shaving, and then drives his car out of the garage and warms it up for him. I have tried to get my wife to adopt these tender, loving gestures, but she won't do it. How can I get her to take a lesson from her mother?

LATE RISER

DEAR LATE: You can't "get" your wife to perform "tender, loving gestures" by demanding them. Find out what your father-in-law does to inspire such thoughtfulness, and take a lesson from HIM.

DEAR ABBY: Since 1 got pregnant four months ago, every little thing upsets me. The house looks a wreck, I never get caught up on my washing and ironing and the kitchen sink is always full of dirty dishes, I can't control the older children. I scream at them until I'm hoarse and whip them until I'm exhausted, I'm so glad when they're at school, I cry a lot when I'm alone and think I must be "crazy." I have prayed for help but none comes. I could never tell this to my doctor. Everyone thinks I'm so calm. This baby will be number ten.

has a problem, nor does she seek help as you have done in writing to me. If you can't talk to your doctor, see your clergyman right away. He will understand and help you, but you must do as he says.

DEAR ABBY: I have noticed on several occasions the question in your column about how much control parents have over their children's mail. Unless Postal Regulations have changed since I retired two years ago, parents have complete control over the mail of their children until the children reach the age of 21 --if they are living at home. Children under 21, living with their parents, are denied the right to rent post office boxes or to receive mail at the General Delivery window.

WASHINGTON (UPI) - Mariner 2's verdict is that lovely Venus is lifeless.

That was the word today in advance of a news conference on what the 447-pound spacecraft discovered when it flew past the brightest of the planets last Dec. 14.

Radio studies had indicated before Marine 2's historic flight that the surface temperature of earth's nearest planetary neighbor was 615 dogrees Fahrenhelt, higher than the melting point of lead.

Scientists have now spent more than two months studying the data from these special instruments. Their conclusion:

Venus is indeed too hot and it. also is too dry to be the abode of life as it is known on earth.
